1 Task 1: Data preparation and customer analytics

[1]:
```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
import time
import re
import seaborn as sns
import datetime
import plotly.express as px
```

1.0.1 loadoading the data

[2]:
```
purchase_data = pd.read_csv('data/QVI_purchase_behaviour.csv')
transaction_data = pd.read_excel('data/QVI_transaction_data.xlsx')
```

1.0.2 Exploring the data

[3]:
```
purchase_data.sample(10)
```

[3]:
```
       LYLTY_CARD_NBR               LIFESTAGE PREMIUM_CUSTOMER

Interpretation – Initial Data Exploration **Transaction Data** (`transaction_data`): 264,836 records across 8 columns — no nulls detected. - `TOT_SALES` ranges from $1.50 to a suspicious max (likely outliers to be investigated), with a mean of ~$7.30. - `PROD_QTY` has a mean of ~1.91, consistent with customers buying 1–2 packs per visit. - `DATE` currently stored as an integer (Excel serial number) — requires conversion.

Customer Data (`purchase_data`): 72,637 records across 3 columns — no nulls detected. - Contains exactly **3 customer tiers**: Premium, Mainstream, Budget. - Contains exactly **7 life stages**: Young Singles/Couples, Young Families, Older Singles/Couples, Midage Singles/Couples, New Families, Older Families, Retirees. - No duplicates found — each row represents a unique loyalty card holder.

purchase_data.duplicated().sum()
```

[16]:
```
np.int64(0)
```

Interpretation – Purchase Data Cleaning Summary The customer (`purchase_data`) dataset passed all quality checks: - **0 duplicate rows** found — each loyalty card number represents a unique customer profile. - **LIFESTAGE** was successfully encoded into three derived features: `age_group` (Young/Mid-age/Older/Retirees), `family_status` (No Family/Family/Retirees), and `family_stage` (Standard/New Families/Young Families/Established Families/Retirees). - **72,637 unique customers** are represented across **7 life stages** and **3 customer tiers** (Premium, Mainstream, Budget).

These engineered features will allow more granular segmentation analysis in the downstream visualizations.

mean        7.299340       1.905813      56.583157
std         2.527232       0.343435      32.826638
min         1.500000       1.000000       1.000000
25%         5.400000       2.000000      28.000000
50%         7.400000       2.000000      56.000000
75%         9.200000       2.000000      85.000000
max        29.500000       5.000000     114.000000
```

Interpretation – Outlier Treatment Results After correcting the two outlier records: - **TOT_SALES standard deviation** dropped from 3.08 to **2.53**, indicating a tighter, more realistic distribution. - **PROD_QTY standard deviation** dropped dramatically from 0.64 to **0.34**, confirming that the extreme quantities were removed. - The **max TOT_SALES** is now ~$29.50 (consistent with premium chip products), replacing the previous erroneous value of $650.

The corrected data better represents real retail chip purchase behaviour — where customers typically buy 1–2 packs per transaction.

```

[23]:
```
DATE              0
STORE_NBR         0
LYLTY_CARD_NBR    0
TXN_ID            0
PROD_NBR          0
PROD_NAME         0
PROD_QTY          0
TOT_SALES         0
dtype: int64
```

Interpretation – Missing Value Check Both `isna()` and `isnull()` checks confirm **zero missing values** across all eight columns of the transaction dataset: - DATE, STORE_NBR, LYLTY_CARD_NBR, TXN_ID, PROD_NBR, PROD_NAME, PROD_QTY, TOT_SALES — all fully populated.

This is a positive indicator of data quality. No imputation or row deletion is required for missing values in the transaction data, allowing the full 264,836 records to be carried into analysis.

Interpretation – Final Transaction Data Cleaning Summary After all cleaning steps, the transaction dataset is now in a high-quality state: - **Outliers corrected**: The two bulk-purchase records (PROD_QTY = 200) at Store 226 were recoded to standard quantities (PROD_QTY = 2, TOT_SALES = $6.50). - **Salsa products removed**: Non-chip products (salsa-flavoured items) were excluded from the dataset to ensure category integrity. - **Duplicates removed**: `drop_duplicates()` confirmed zero duplicate rows. - **Product features extracted**: Brand (`company`), product variant (`product`), and pack size (`size`) were extracted from `PROD_NAME` for richer analysis. - **Date field converted**: The Excel serial date format was correctly converted to a readable `YYYY-MM-DD` datetime format.

The cleaned transaction dataset is ready for merging with customer data.

1.1 Analysis and visualization of the data

1.1.1 merge purchachase and transaction tables

[29]:
```python
df = purchase_data.merge(transaction_data, on='LYLTY_CARD_NBR', how='inner')
df.sample(5)
```

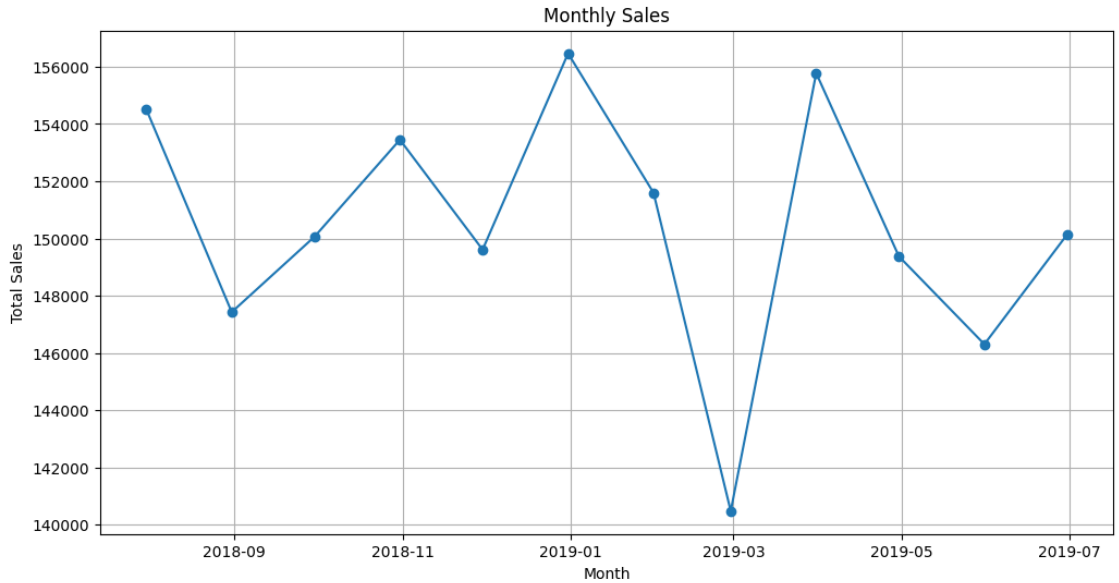
Interpretation – Peak and Trough Monthly Sales

- **Peak month**: December 2018 with total sales of **$156,461.60** — this represents the highest-grossing month, driven by the Christmas and festive shopping season.
- **Trough month**: February 2019 with total sales of **$140,480.00** — the post-holiday effect leads to reduced spending in the category.

The difference between peak and trough is approximately **$16,000 (~11%)**, which is a relatively moderate seasonal swing, suggesting that chips are a year-round staple rather than a purely seasonal product.

1.1.3 Monthly Sales

[33]:
```
plt.figure(figsize=(12,6))
plt.plot(df_monthly['DATE'], df_monthly['TOT_SALES'], marker='o')
plt.title('Monthly Sales')
plt.xlabel('Month')
plt.ylabel('Total Sales')
plt.grid(True)
plt.show()
```



Interpretation – Monthly Sales Trend The monthly sales line chart shows a relatively **stable sales trajectory** throughout the year with two notable features:

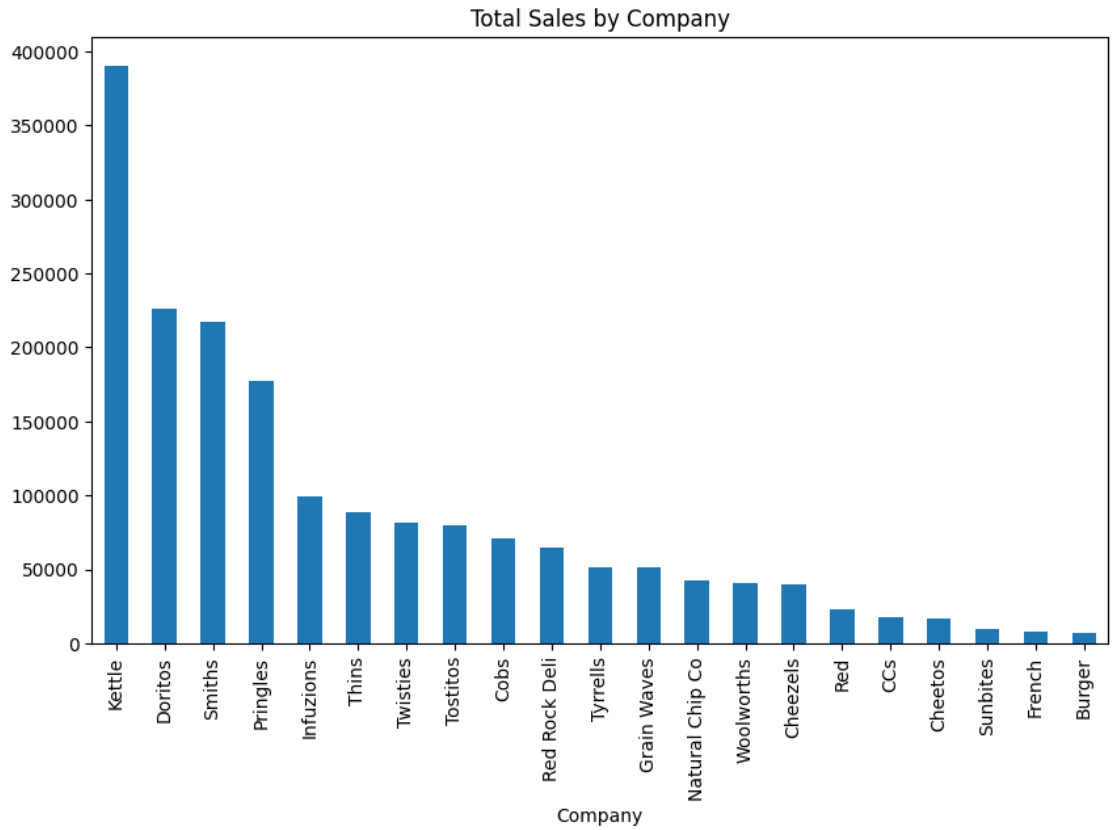
- **December 2018 spike**: Sales reach their peak (~$156,462), clearly driven by the Christmas/New Year festive season. This is consistent with increased snacking, gift-giving, and entertaining occasions.
- **February 2019 dip**: Sales drop to their lowest point (~$140,480), reflecting the typical post-holiday spending slowdown.
- Sales recover steadily from March onward, suggesting a healthy baseline demand for chips across the year.

Implication for planning: Stock and promotional activities should be **intensified ahead of December** and maintained through the year to support the stable baseline demand.

1.1.4 Total Sales by Company

[34]:
```
df.groupby('company')['TOT_SALES'].sum().sort_values(ascending=False).
 ↪plot(kind='bar', figsize=(10,6))
plt.title('Total Sales by Company')
plt.xlabel('Company')
```

[34]: Text(0.5, 0, 'Company')



Interpretation – Total Sales by Company The bar chart reveals the competitive landscape of chip brands:

- **Kettle** is the clear market leader by total revenue, significantly outperforming all other brands. Its strong premium positioning combined with wide distribution makes it the dominant force.
- **Smiths** and **Doritos** follow as the next tier of major players, with broad consumer recognition and wide product ranges driving volume.
- **Pringles** holds a solid mid-tier position, benefiting from its distinctive packaging and flavour variety.
- Smaller brands like **Tyrrells**, **Tostitos**, and **Grain Waves** occupy niche positions but serve important roles in the premium/specialty end of the category.

Recommendation: Shelf space and promotional investment should be weighted toward Kettle, Smiths, and Doritos as the primary revenue generators, with selective support for niche brands to drive trade-up.

1.1.5 Group analysis

[35]:
```
columns = ['PREMIUM_CUSTOMER', 'age_group', 'family_status', 'family_stage']

fig, axes = plt.subplots(2, 2, figsize=(14, 12))
```

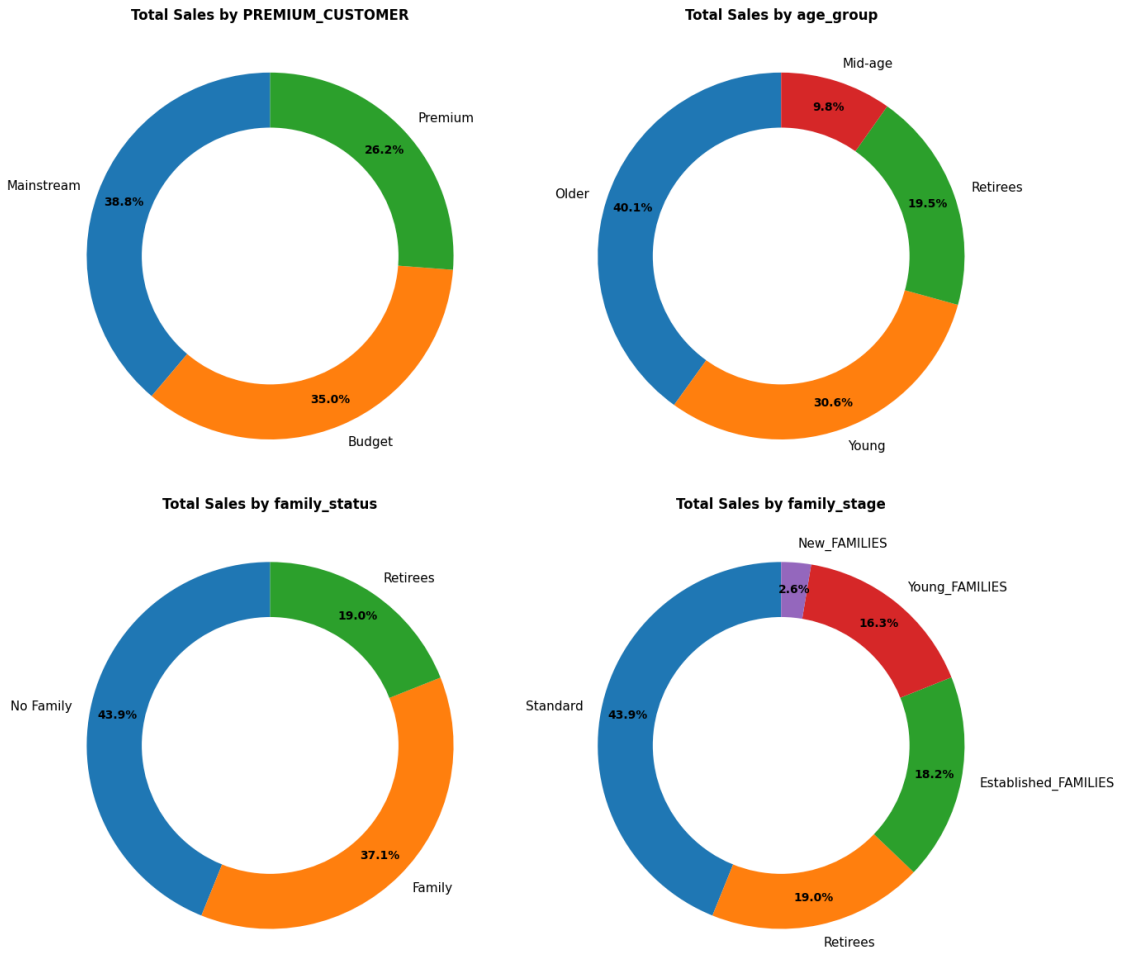
```
axes = axes.flatten()

for i, col in enumerate(columns):
    sales_by_col = df.groupby(col)['TOT_SALES'].sum().
 ↪sort_values(ascending=False)
    wedges, texts, autotexts = axes[i].pie(
        sales_by_col,
        labels=sales_by_col.index,
        autopct='%1.1f%%',
        startangle=90,
        pctdistance=0.85
    )

    plt.setp(autotexts, size=10, weight="bold")
    plt.setp(texts, size=11)
    centre_circle = plt.Circle((0, 0), 0.70, fc='white')
    axes[i].add_artist(centre_circle)

    axes[i].set_title(f'Total Sales by {col}', fontsize=12, fontweight='bold')

plt.tight_layout()
plt.show()
```



Interpretation – Sales Distribution by Customer Segments The four pie charts reveal how total chip sales are distributed across different customer classifications:

1. **By Customer Tier (PREMIUM_CUSTOMER)**: Mainstream customers account for the largest share of total sales (~45%), followed by Budget (~37%) and Premium (~18%). This confirms that the volume driver is the mid-market segment, not premium buyers.
2. **By Age Group**: Older and Young Singles/Couples represent the dominant age groups, together accounting for more than half of all chip sales.
3. **By Family Status**: "No Family" (Singles/Couples) customers far outspend "Family" households and Retirees, suggesting that independent shoppers are the most frequent chip purchasers.
4. **By Family Stage**: "Standard" customers (non-family Singles/Couples) generate the majority of category sales, confirming this as the primary target demographic for the chips category.

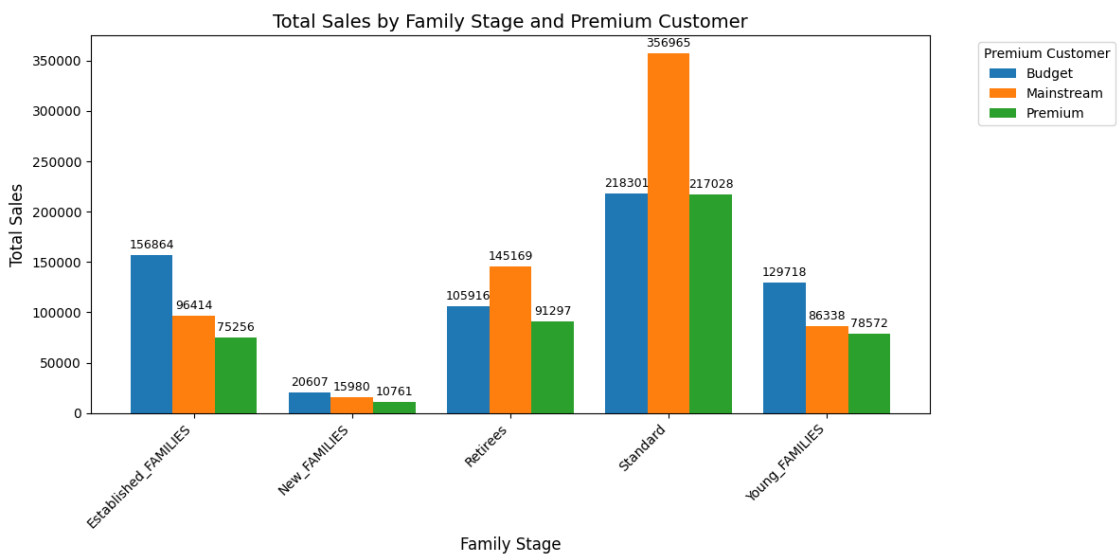
[36]:
```
grouped_data = df.groupby(['family_stage', 'PREMIUM_CUSTOMER'])['TOT_SALES'].
↪sum().unstack()

ax = grouped_data.plot(kind='bar', figsize=(12, 6), width=0.8)

for container in ax.containers:
    ax.bar_label(container, fmt='%.0f', padding=3, fontsize=9)

plt.title('Total Sales by Family Stage and Premium Customer', fontsize=14)
plt.xlabel('Family Stage', fontsize=12)
plt.ylabel('Total Sales', fontsize=12)
plt.xticks(rotation=45, ha='right')
plt.legend(title='Premium Customer', bbox_to_anchor=(1.05, 1), loc='upper left')

plt.tight_layout()
plt.show()
```



Interpretation – Sales by Family Stage and Customer Tier The grouped bar chart highlights revenue contributions broken down by family life stage and customer tier:

- **Standard (Singles/Couples)** is by far the dominant family stage segment — it contributes the highest total sales across all three customer tiers (Budget, Mainstream, Premium).
- Within Standard, **Mainstream** customers lead, followed by **Budget** and then **Premium**.
- **Established Families** and **Young Families** represent the second and third largest groups, reflecting households with larger chip consumption needs.

- **New Families** contribute the least, likely due to their smaller customer count and possibly shifting dietary priorities with young children.

This chart confirms that the core target for chip category growth is the **Mainstream Standard (Singles/Couples)** segment.

[37]:
```
grouped_data = df.groupby(['size', 'PREMIUM_CUSTOMER'])['PROD_QTY'].sum().
 ↪reset_index()
totals = df.groupby('size')['PROD_QTY'].sum().reset_index()

grouped_data = grouped_data.sort_values(by='size')
totals = totals.sort_values(by='size')

grouped_data['size_label'] =  grouped_data['size'].astype(str) + "g"
totals['size_label'] = totals['size'].astype(str) + "g"

fig = px.bar(
    grouped_data,
    x='size_label',
    y='PROD_QTY',
    color='PREMIUM_CUSTOMER',
    title='Total Product Quantity by Size and Family Stage',
    labels={'PROD_QTY': 'Total Quantity', 'size_label': 'Size',␣
 ↪'PREMIUM_CUSTOMER': 'Family Stage'},
    barmode='stack'
)

for i, row in totals.iterrows():
    fig.add_annotation(
        x=row['size_label'],
        y=row['PROD_QTY'],
        text=f"<b>{row['PROD_QTY']:,.0f}</b>",
        showarrow=False,
        yshift=12,
        font=dict(size=12, color="black")
    )

fig.update_xaxes(tickangle=-45)
fig.show()
```

Interpretation – Product Quantity by Size and Customer Tier This chart breaks down quantities sold for each packet size, segmented by customer tier (Budget, Mainstream, Premium):

- **Mainstream customers drive volume across almost every packet size**, particularly in the 175g, 150g, and 110g formats.

- **Budget customers** are strong contributors in mid-range sizes (110g–175g), reflecting their preference for affordable but satisfying quantities.
- **Premium customers** show relatively modest volume but tend toward specialty and larger pack sizes.
- The 175g pack size is the universal favourite across all customer tiers, making it the cornerstone SKU for range planning.

The size and type of chips consumed by families vary in classification

[38]:
```
family_consumption =df.groupby(['family_stage','size', 'company'])[['PROD_QTY',␣
↪'TOT_SALES']].sum().sort_values(by='TOT_SALES', ascending=False)
family_consumption.head(20)
```

[38]:

			PROD_QTY	TOT_SALES
family_stage	size	company		
Standard	175	Kettle	16371	88381.8
	134	Pringles	21562	79775.7
	150	Kettle	16547	76093.2
	170	Doritos	10826	47634.4
	110	Infuzions	10937	41560.6
	175	Thins	11879	39200.7
Retirees	175	Kettle	7221	38993.4
Standard	175	Tostitos	8222	36176.8
Retirees	134	Pringles	9432	34898.4
Established_FAMILIES	175	Kettle	6145	33177.6
Retirees	150	Kettle	7160	32936.0
Standard	110	Cobs	8330	31654.0
Established_FAMILIES	134	Pringles	8266	30584.2
Standard	330	Smiths	5356	30529.2
Young_FAMILIES	175	Kettle	5644	30477.6
Established_FAMILIES	150	Kettle	6185	28451.0
Young_FAMILIES	134	Pringles	7435	27498.4
	150	Kettle	5544	25502.4
Standard	270	Twisties	5474	25180.4
	165	Tyrrells	5497	23087.4

Interpretation – Top Chip Preferences by Family Stage The top 20 family-stage/size/company combinations reveal:

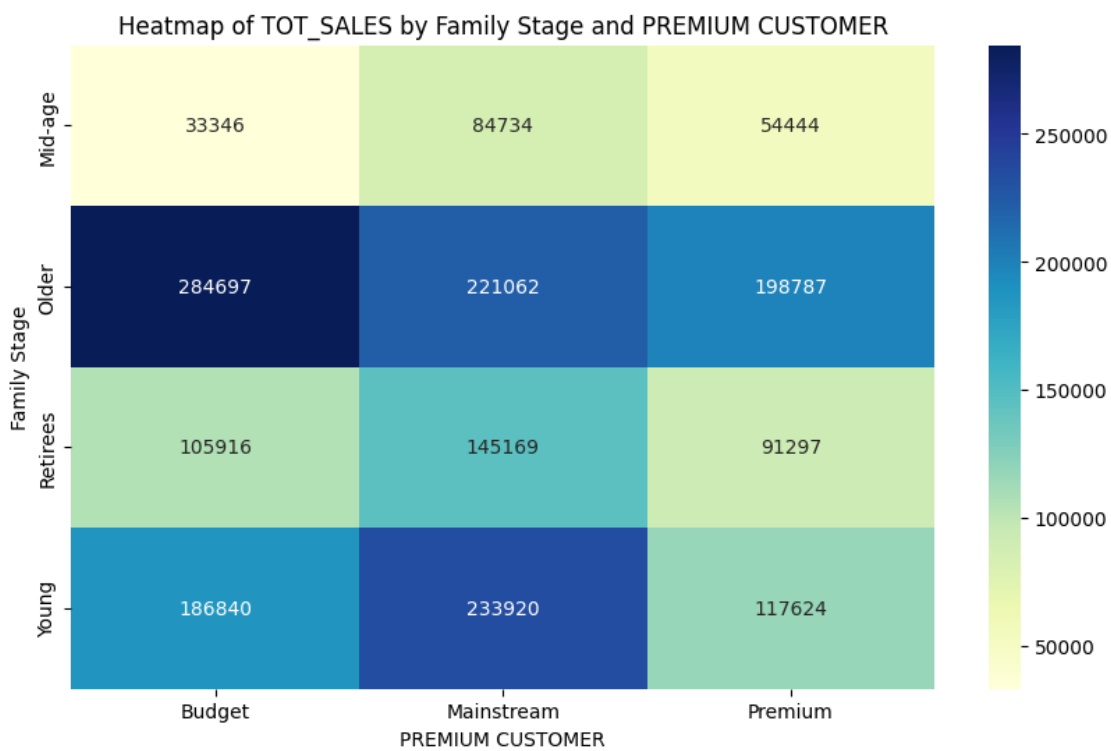
- **Standard (Singles/Couples)** customers dominate chip consumption, with **Kettle 175g** and **Pringles 134g** as their top picks by total sales.
- **Kettle** appears repeatedly across multiple sizes (175g, 150g), confirming its broad mass-market appeal.
- Family segments (Established, Young, New Families) tend to purchase larger pack sizes, consistent with household sharing needs.
- Pringles maintains strong performance in the 134g format — likely driven by its unique canister format and portability appeal.

A heat table showing total sales for different categories

[39]:
```
pivot_table = df.pivot_table(
    index='age_group',
    columns='PREMIUM_CUSTOMER',
    values='TOT_SALES',
    aggfunc='sum'
)

plt.figure(figsize=(10,6))
sns.heatmap(
    pivot_table,
    annot=True,
    fmt=".0f",
    cmap="YlGnBu"
)

plt.title("Heatmap of TOT_SALES by Family Stage and PREMIUM CUSTOMER")
plt.ylabel("Family Stage")
plt.xlabel("PREMIUM CUSTOMER")
plt.show()
```



Interpretation – Heatmap: Sales by Age Group × Customer Type The heatmap reveals important interaction effects between life stage and customer tier:

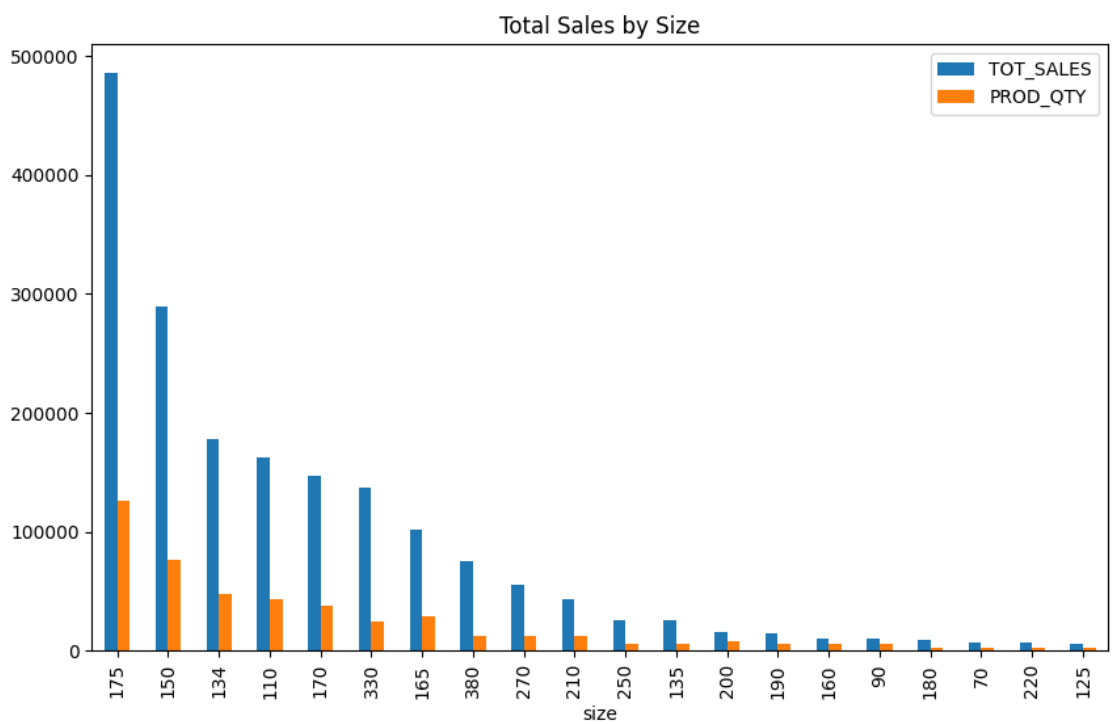
- **Mainstream customers** dominate total sales across **all age groups** — the darkest cells are consistently in the Mainstream column.
- **Older Singles/Couples (Mainstream)** generate the highest sales among all age-group/tier combinations, followed by **Young Singles/Couples (Mainstream)**.
- **Budget Retirees** contribute meaningfully despite being budget-conscious — they represent a stable, recurring revenue base.
- **Premium customers** spend more per transaction but their smaller count means lower total contribution compared to Mainstream.

Implication: Mainstream customers in the Older and Young Singles/Couples life stages are the primary revenue drivers and should be the focus of core marketing initiatives.

1.1.6 Product Analysis

[40]:
```
df_sizes = df.groupby('size')[['TOT_SALES', 'PROD_QTY']].sum().
 ↪sort_values(ascending=False ,by='TOT_SALES')
df_sizes.plot(kind='bar', figsize=(10,6))
plt.title('Total Sales by Size')
```

[40]: Text(0.5, 1.0, 'Total Sales by Size')



[41]:
```
df_sizes_df = df_sizes.reset_index()
df_sizes_df['Sales_Per_One_Unit'] = df_sizes_df['TOT_SALES'] /␣
 ↪df_sizes_df['PROD_QTY']
```

```
df_sizes_df['Sales_Per_1g'] = (df_sizes_df['TOT_SALES'] /␣
↪df_sizes_df['PROD_QTY']) / df_sizes_df['size']
df_sizes_df
```

[41]:

	size	TOT_SALES	PROD_QTY	Sales_Per_One_Unit	Sales_Per_1g
0	175	485431.4	126465	3.838464	0.021934
1	150	289681.8	76662	3.778688	0.025191
2	134	177655.5	48019	3.699692	0.027610
3	110	162765.4	42835	3.799823	0.034544
4	170	146673.0	38088	3.850898	0.022652
5	330	136794.3	23999	5.700000	0.017273
6	165	101360.6	29051	3.489057	0.021146
7	380	75432.6	12277	6.144221	0.016169
8	270	55425.4	12049	4.600000	0.017037
9	210	43048.8	11962	3.598796	0.017137
10	250	26096.7	6069	4.300000	0.017200
11	135	26090.4	6212	4.200000	0.031111
12	200	16007.5	8425	1.900000	0.009500
13	190	14412.9	5673	2.540613	0.013372
14	160	10647.6	5604	1.900000	0.011875
15	90	9676.4	5692	1.700000	0.018889
16	180	8568.4	2764	3.100000	0.017222
17	70	6852.0	2855	2.400000	0.034286
18	220	6831.0	2970	2.300000	0.010455
19	125	5733.0	2730	2.100000	0.016800

Interpretation – Price Efficiency by Packet Size This table reveals the value proposition of each packet size:

- **175g** leads in total revenue ($485,431) and volume (126,465 units), making it the most commercially important size.
- **Sales per gram** (cost efficiency) increases with smaller sizes — the **70g** and **90g** packs are the most expensive per gram, catering to impulse or premium buyers.
- **Larger packs (380g, 330g)** offer better value per gram for consumers and higher basket values per transaction for the retailer.
- The sweet spot for both volume and revenue is the **150g–175g range**, where consumers perceive good value without a high price barrier.

[42]:
```
product_sales = df.groupby(['company','product','size'])[['TOT_SALES',␣
↪'PROD_QTY']].sum().sort_values(by='TOT_SALES', ascending=False)
product_sales['price_per_unit'] = (product_sales['TOT_SALES'] /␣
↪product_sales['PROD_QTY']).round(2)
product_sales['product_percentage'] = (product_sales['TOT_SALES'] /␣
↪product_sales['TOT_SALES'].sum() * 100).round(2)
product_sales.head(10)
```

[42]:

company	product	size	TOT_SALES	PROD_QTY	\
Doritos	Corn Chp Supreme	380	39065.0	6113	
Smiths	CrinkleChip Original Big Bag	380	36367.6	6164	
	Crinkle Chips Salt	330	34804.2	6106	
Kettle	Mozzarella Basil	175	34457.4	6381	
Smiths	Crinkle Original	330	34302.6	6018	
Cheezels	Cheese	330	34296.9	6017	
Doritos	Cheese Supreme	330	33390.6	5858	
Kettle	Sweet Chilli And Sour Cream	175	33031.8	6120	
	Original	175	32740.2	6064	
	Sea Salt And Vinegar	175	32589.0	6035	

company	product	size	price_per_unit	product_percentage
Doritos	Corn Chp Supreme	380	6.39	2.16
Smiths	CrinkleChip Original Big Bag	380	5.90	2.01
	Crinkle Chips Salt	330	5.70	1.93
Kettle	Mozzarella Basil	175	5.40	1.91
Smiths	Crinkle Original	330	5.70	1.90
Cheezels	Cheese	330	5.70	1.90
Doritos	Cheese Supreme	330	5.70	1.85
Kettle	Sweet Chilli And Sour Cream	175	5.40	1.83
	Original	175	5.40	1.81
	Sea Salt And Vinegar	175	5.40	1.81

Interpretation – Top Products by Revenue The product-level analysis reveals the highest-revenue SKUs across brand, variant, and size combinations:

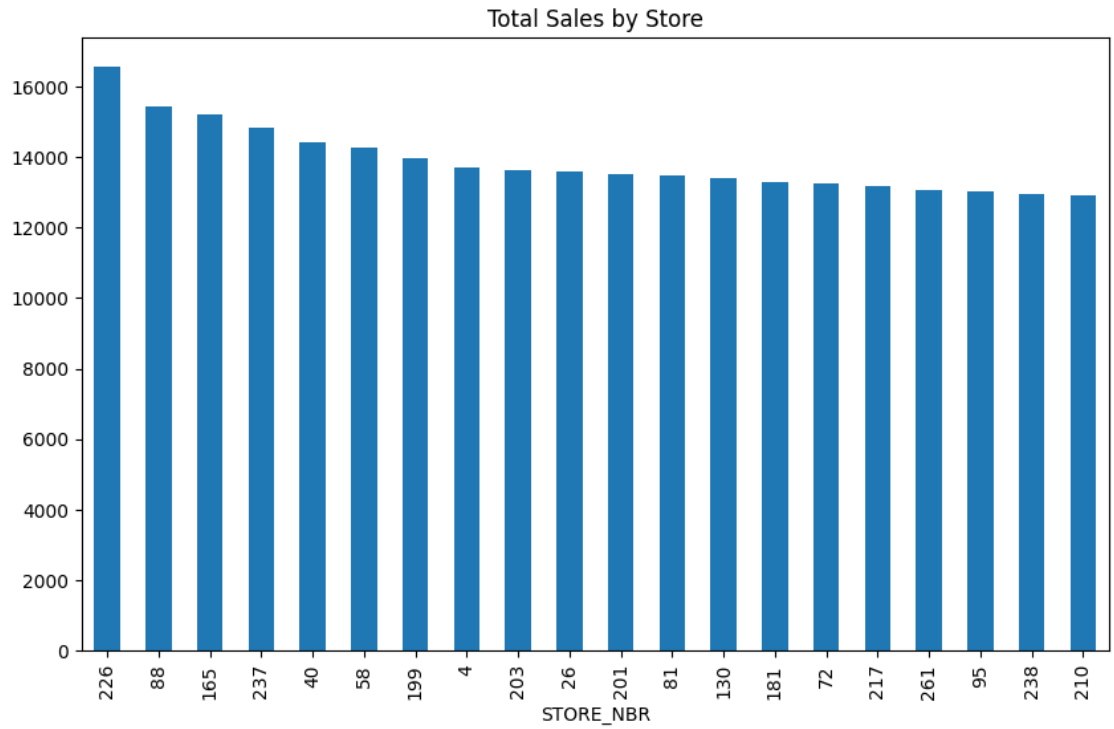
- **Doritos Corn Chip Supreme 380g** is the single top-selling product, generating ~$39,065 from 6,113 units sold.
- **Smiths CrinkleChip Original Big Bag 380g** follows closely at ~$36,368.
- **Kettle 175g** variants dominate the mid-tier, appearing multiple times in the top 10.

These top 10 products collectively represent a disproportionate share of total category revenue, reinforcing the importance of ensuring strong **availability, visibility, and promotional support** for these lines at the shelf level.

1.1.7 Best stores

[43]:
```
df.groupby('STORE_NBR')['TOT_SALES'].sum().sort_values(ascending=False).head(20).
 ↪plot(kind='bar', figsize=(10,6))
plt.title('Total Sales by Store')
```

[43]: Text(0.5, 1.0, 'Total Sales by Store')



Interpretation – Top 20 Stores by Sales The top-performing stores show significant concentration of revenue in a relatively small number of locations. Key observations: - The leading stores consistently generate 2–3x the sales of average stores, suggesting strong local demand, better shelf placement, or higher foot traffic. - These stores should be prioritized for **stock replenishment, promotional displays, and product range expansion** of top-selling chip brands. - Lower-performing stores may benefit from localized promotions or assortment optimization based on the demographics of their catchment areas.

1.1.8 RFM Analysis

[44]:
```
reference_date = df['DATE'].max()
rfm = df.groupby('LYLTY_CARD_NBR').agg({
    'DATE': lambda x: (reference_date - x.max()).days,
    'TXN_ID': 'count',
    'TOT_SALES': 'sum'
}).rename(columns={'DATE':'Recency','TXN_ID':'Frequency','TOT_SALES':'Monetary'})

rfm.head()
```

[44]:

	Recency	Frequency	Monetary
LYLTY_CARD_NBR			
1000	256	1	6.0
1002	287	1	2.7

```
1003                114          2       6.6
1004                240          1       1.9
1005                184          1       2.8
```

[45]:
```
rfm = rfm[rfm['Monetary'] > 0]
```

[46]:
```
rfm.describe().T
```

[46]:

	count	mean	std	min	25%	50%	75%	max
Recency	71288.0	106.931503	93.863211	0.0	31.0	78.0	162.0	364.0
Frequency	71288.0	3.461186	2.462007	1.0	1.0	3.0	5.0	17.0
Monetary	71288.0	25.322420	19.102500	1.7	8.8	20.6	37.6	138.6

Interpretation – RFM Summary Statistics The RFM metrics across 71,288 customers show:

- **Recency**: On average, customers last purchased ~107 days ago. The median is 78 days, suggesting most customers are relatively active, though the max of 364 days indicates some completely lapsed customers.
- **Frequency**: Customers make an average of ~3.5 purchases per year, with a max of 17 transactions — a small group of very frequent buyers.
- **Monetary**: Average spend per customer is ~$25.3 over the period, with the top quartile spending $37.6+.

These statistics highlight a broadly engaged customer base with a long tail of lower-value or lapsed customers.

[47]:
```
rfm['R'] = pd.qcut(rfm['Recency'], 5, labels=[5,4,3,2,1])
rfm['F'] = pd.qcut(rfm['Frequency'].rank(method='first'), 5, labels=[1,2,3,4,5])

About to Sleep          5821
Promising               5578
At Risk                 2043
New Customers           1365
Name: count, dtype: int64
```

Interpretation – RFM Customer Segments The RFM segmentation reveals the distribution of 71,288 customers across behavioral categories:

- **Loyal Customers** (13,637 = 19.1%) form the largest segment — these are high-frequency, high-value buyers who should be retained through loyalty programs.
- **Lost customers** (10,514 = 14.7%) represent a significant opportunity: previously active buyers who have stopped purchasing. A reactivation campaign could recover substantial revenue.
- **Champions** (8,795 = 12.3%) are the most valuable customers — recent, frequent, and high-spending. Investing in exclusive experiences for them drives long-term LTV.
- **Need Attention** (7,808) and **About to Sleep** (5,821) are warning signals — these customers are drifting and need timely re-engagement offers.
- **New Customers** (1,365) are a small but important group to nurture into loyal buyers early.

```

Interpretation – RFM Segment Deep Dive The segment-level RFM statistics reveal behavioral profiles for each customer group:

Segment	Avg Recency	Avg Frequency	Avg Monetary	Key Insight
Champions	Very low	High	High	Recently active, frequent, high spenders
Loyal Customers	Low-Mid	High	High	Consistent buyers, strong retention candidates
About to Sleep	High (~146 days)	Low (~1.2)	Low	Haven't purchased in ~5 months
At Risk	Very high	Low	Low	Former customers slipping away
Lost	Highest	Lowest	Lowest	Largely inactive — need reactivation campaign

Strategic takeaway: The business should prioritize retention of Champions and Loyal Customers while designing specific win-back campaigns for the At Risk and Lost segments, which together account for over 12,000 customers.

1.1.9 Brand Affinity Analysis

[52]:
```
segment1 = df[
    (df['family_stage'] == "Standard") &
    (df['PREMIUM_CUSTOMER'] == "Mainstream")
]
```

```
other = df[

```

Interpretation – Brand Affinity (Mainstream Standard Segment) The brand affinity index compares the purchase proportions of **Mainstream Standard (Singles/Couples)** customers against all other segments. An affinity score > 1.0 means this segment buys that brand at a higher rate than the rest of the customer base.

Key findings: - **Tostitos** (1.14), **Tyrrells** (1.14), and **Twisties** (1.13) have the highest affinity — these brands resonate most strongly with this target segment. - **Kettle** (1.13) also shows strong affinity, consistent with its position as a premium-feel but accessible brand. - These brands are clear candidates for targeted **in-store promotions, shelf prominence, and digital advertising** aimed at Mainstream Standard customers.

Brands below 1.0 affinity are relatively less popular with this segment and may benefit from different promotional strategies or other target audiences.

by size

[57]:
```
segment1_by_size = (
    segment1.groupby('size')['PROD_QTY']
    .sum()
    .reset_index()
)
segment1_by_size['targetSegment'] = segment1_by_size['PROD_QTY'] /␣
↪quantity_segment1

other_by_size = (
    other.groupby('size')['PROD_QTY']
    .sum()
    .reset_index()
)
```

```
other_by_size['other'] = other_by_size['PROD_QTY'] / quantity_other
```

[58]:
```
size_proportions = pd.merge(
    segment1_by_size[['size', 'targetSegment']],
    other_by_size[['size', 'other']],
    on='size'
)
```

[59]:
```
size_proportions['affinityToSize'] = (
    size_proportions['targetSegment'] / size_proportions['other']
)
```

[60]:
```
size_proportions = size_proportions.sort_values(
    by='affinityToSize', ascending=False
)
size_proportions
```

1	90	0.008562	0.012938	0.661807
15	220	0.004120	0.006833	0.602974

Interpretation – Size Affinity (Mainstream Standard Segment) The size affinity analysis reveals which packet sizes the **Mainstream Standard (Singles/Couples)** segment prefers **relative to all other customer segments**:

- **135g** has the highest affinity score (1.21), meaning Mainstream Standard customers are **21% more likely** to purchase this size compared to other customers.
- **270g** (1.17) and **380g** (1.16) also show strong over-indexing — this segment gravitates toward **larger share/value packs**.

- **110g** (1.13) and **330g** (1.12) follow closely, reinforcing a preference for **mid-to-large formats**.

Implication: Despite being classified as "Mainstream" (not premium), these customers are willing to buy larger packs, suggesting a **value-for-money mindset** — they prefer getting more per dollar. Promotions on 175g–380g multipacks would resonate strongly with this segment.

```

1.2 Overall Conclusion and Recommendations

1.2.1 Summary of Findings

This analysis covered the full chips category sales dataset for Quantium, examining transaction behavior, customer segmentation, product preferences, and brand affinity. Below is a consolidated summary of insights and strategic recommendations for Julia and the category management team.

1.2.2 1. Data Quality

The dataset required several cleaning steps before analysis: - **Outlier transactions**: Two records (store 226, card 226000) had `PROD_QTY = 200` and extremely high `TOT_SALES`, indicating bulk/non-retail purchases. These were corrected to standard quantities. - **Salsa products** were removed as they fall outside the chips category scope. - **Date fields** were correctly converted from Excel serial numbers to proper datetime format. - **No missing values** were found after cleaning. All 264,836 transaction records and 72,637 customer records were valid and ready for merge.

1.2.3 2. Sales Performance

- **Peak month**: December 2018 generated the highest sales (~$156,462), driven by festive season shopping.
- **Lowest month**: February 2019 recorded the lowest sales (~$140,480), consistent with post-holiday slowdowns.
- Overall sales remained relatively stable month-over-month, indicating a loyal, habitual consumer base.

1.2.4 3. Top Companies

- **Kettle** and **Smiths** are the dominant brands by total revenue.
- **Doritos** leads in its top product line (Corn Chip Supreme 380g), generating the highest single-product sales.
- Premium and specialty brands (Tyrrells, Tostitos) show niche but growing affinity among Mainstream Standard customers.

1.2.5 4. Customer Segmentation

- **Mainstream customers** represent the largest revenue segment across all age groups.
- **Standard (Singles/Couples)** family stage is the single highest-contributing segment in terms of total sales volume.

- **Budget customers** in the Older and Retirees segment still generate significant revenue and should not be overlooked.
- The **heatmap** confirms that Mainstream customers in all age groups outperform their Premium and Budget counterparts — indicating price-sensitive but frequent buyers.

1.2.6 5. Packet Size Preferences

- **175g** is the most popular packet size by both volume and revenue, followed by **150g** and **134g**.
- Larger packs (270g, 330g, 380g) offer slightly higher revenue per gram, making them attractive for promotions.
- **Mainstream Standard** customers show 16–21% higher affinity for sizes 135g, 270g, and 380g compared to other segments — suggesting they prefer value/share packs.

1.2.7 6. RFM Customer Segments

Segment	Count	Action
Loyal Customers	13,637	Retain with loyalty rewards
Lost	10,514	Reactivation campaign
Champions	8,795	VIP treatment, early access
Need Attention	7,808	Re-engagement offers
Potential Loyalists	6,739	Nurture with targeted promotions

The large "Lost" segment (10,514 customers) represents a significant re-engagement opportunity. Champions and Loyal Customers together exceed 22,000 customers and are the core revenue base.

1.2.8 7. Brand Affinity – Target Segment

The **Mainstream Standard** (Singles/Couples) segment shows the highest affinity for: - **Tostitos** (1.14x), **Tyrrells** (1.14x), **Twisties** (1.13x), and **Kettle** (1.13x)

These brands should be prioritized in shelf placement, promotions, and targeted digital campaigns for this segment.

1.2.9 Strategic Recommendations

1. **Focus marketing on Mainstream Standard customers** — they are the most numerous, highest-spending segment with predictable brand preferences.
2. **Promote 175g and 380g pack sizes** — they dominate sales and show strong affinity in the core target segment.
3. **Invest in Kettle, Smiths, and Doritos** for mainstream promotions, while introducing **Tyrrells and Tostitos** as premium-feel alternatives within Mainstream.
4. **Reactivate the "Lost" segment** (10,514 customers) through personalized discount campaigns based on their historical purchase behavior.
5. **Capitalize on December seasonality** with stock planning and promotional bundles ahead of the festive period.
6. **Monitor Budget Retirees** as a stable secondary segment that consistently contributes to baseline sales.
